

HIGH AUGMENTATION, MEDIUM AUTOMATION · 13-1111.00

Management Analyst

AI accelerates analysis, but does not own diagnosis.

Management analysis is highly exposed to AI-enabled time compression because the work is rich in data gathering, document review, benchmarking, option development, and recommendation drafting. The danger is not that AI produces too little, but that it produces plausible analysis without enough organizational context. AI-OS therefore treats AI as a research, synthesis, modeling, and first-draft engine while preserving human responsibility for diagnosis, stakeholder judgment, implementation design, and political feasibility.

Estimated task-time compression

53.9%

64.7 monthly hours released from a normalized 120-hour baseline.

Tasks assessed

55.3h

Future residual work

5.8

Avg Decision Compass

Medium-high

Control burden

AI mode distribution

Baseline to future workload

Savings are task-time compression estimates, not headcount reduction claims.

Method and operating interpretation

AI-OS starts below the job title. Each occupation is decomposed into O*NET task statements. The model normalizes the occupation to 120 productive monthly hours, allocates that time across tasks using importance, relevance, expected frequency, and task type, then applies the AI-OS mode assumptions: Automate equals 20 percent residual effort, Assist equals 50 percent, Advise equals 70 percent, and Human-only equals 100 percent. Decision Compass risk factors then shape the control architecture.

High capability, high risk

Use AI for preparation, comparison, drafting, and evidence organization. Keep approval, interpretation, and accountability human.

High capability, medium risk

Good fit for Assist mode: standardized documentation, summaries, structured analysis, and routine follow-up.

Medium capability, high risk

Use only in Advise mode where the work affects people, money, rights, compliance, or institutional trust.

Low capability or high accountability

Keep human-led where legitimacy, empathy, final judgment, professional assurance, or strategic trade-offs dominate.

Task cluster profile

Rebundled role direction

- Evidence orchestration and synthesis
- Human-led diagnosis and change design
- Implementation governance and stakeholder translation

Priority tasks and control architecture

Task	Mode	Saved	Risk	Control requirement
Analyze data gathered and develop solutions or alternative methods of proceeding.	Automate	12.2h	5	Sample review, audit log, exception queue
Plan study of work problems and procedures, such as organizational change, communications, information flow,...	Automate	8.8h	5	Sample review, audit log, exception queue
Review forms and reports and confer with management and users about format, distribution, and purpose,...	Automate	8.1h	5	Sample review, audit log, exception queue
Document findings of study and prepare recommendations for implementation of new systems, procedures, or...	Assist	5.8h	6	Human review before use, source check, version control
Interview personnel and conduct on-site observation to ascertain unit functions, work performed, and methods,...	Assist	5.6h	5	Human review before use, source check, version control

Control architecture

- Require source traceability for research and benchmark claims.
- Separate AI-generated options from human-approved recommendations.
- Document assumptions, exclusions, and alternative explanations.
- Validate proposed changes with affected stakeholders before implementation.
- Treat AI outputs as draft analysis, not organizational diagnosis.

How to read this result

The Management Analyst example shows an estimated 53.9 percent task-time compression. This is not a claim that the occupation should shrink by that amount. It means AI can release preparation, documentation, analysis, or routine-processing capacity if governance is strong enough. The redesign question is what humans should now spend more time doing.
